Idle Game UI Front-End Reference

Daily Check-In Systems and Quest Systems

Purpose: give designers and front-end engineers a shared reference for the most common reward and task UX patterns used in mobile and idle games, plus recommended implementation details for your project.

Recommended default direction for your game:
Check-in: use a calendar or horizontal reward track.
Quests: use card-based tasks with progress bars, reward previews, and a meta chest for completing multiple tasks.

Pattern	System	Primary use
Calendar Reward Grid	Daily check-in	Best when you want a familiar streak-driven reward calendar.
Horizontal Reward Track	Daily check-in	Best for cleaner portrait layouts and milestone emphasis.
Instant Reward Popup	Daily check-in	Best when you want the daily reward to feel fast and low-friction.
Quest Checklist Panel	Quest system	Best for dense daily/weekly objective lists.
Quest Card Layout	Quest system	Best for richer UI, stronger hierarchy, and action buttons.
Quest Completion Milestone	Quest system	Best for a meta chest that nudges players to finish more tasks.

1. Calendar Reward Grid

A grid of day-by-day rewards. This is the most recognizable daily login pattern in mobile games.

Styling cues
- Grid layout, usually 7 days or 14/30 days split into rows
- Claimed days show a checkmark or stamped state
- Current day uses the strongest highlight treatment
- Future rewards are dimmed or locked
- Milestone days use rarer frames, larger cards, or premium currencies

Element	What it does
Day tile	Container for one reward day.
Day label	Visible day number or date marker.
Reward payload	Icon + amount + rarity treatment.
Claim state	Locked, available, claimed, missed, or recovered.
Milestone emphasis	Special frame or glow for day 7, 14, 30, etc.
Primary CTA	Claim or Claim All when applicable.

Implementation notes
- Use this when you want streak logic to be legible at a glance.
- Good fit if your rewards escalate visibly over the first 7–14 days.
- Support both consecutive streak and cumulative attendance modes if you plan to run events.

Reference examples

Reference example A — sign-in ladder with daily reward points

Source	State of Survival Daily Rewards / Missions screen
Pattern fit	Hybrid between a calendar and a horizontal reward ladder
Why it is useful	Shows reward thresholds across the top, daily task rows below, and a strong claim CTA. Good example of combining check-in with daily activity rewards.
Reference URL	https://www.bluestacks.com/blog/game-guides/state-of-survival/sos-daily-to-do-list-en.html

2. Horizontal Reward Track

A line of sequential rewards arranged horizontally. Feels more modern than a calendar and is easier to fit into portrait mobile layouts.

Styling cues
- Scrollable horizontal reward rail
- Sequential nodes connected by a progress line
- Milestones displayed as larger nodes or chests
- Current node highlighted with an active ring, glow, or pulse
- Often paired with a compact summary panel and countdown timer

Element	What it does
Progress rail	Connects all reward nodes visually.
Reward node	Represents one day or one checkpoint.
Current position	Active marker or progress indicator.
Threshold labels	Day number or point threshold.
Milestone node	Chest or premium reward for bigger checkpoints.
Reset timer	Shows when the sequence refreshes.

Implementation notes
- Best when you want to avoid a visually heavy grid.
- Works especially well for seasonal or event check-ins.
- If your game is mostly portrait-first, this often reads cleaner than a large calendar.

Reference examples

Reference example A — point-based reward rail

Source	State of Survival Daily Rewards / Missions screen
Pattern fit	Strong fit for a horizontal reward track with tiered reward boxes
Why it is useful	Useful because it places thresholds and unopened reward chests across a single horizontal line, which maps well to cumulative check-in or daily activity score designs.
Reference URL	https://www.bluestacks.com/blog/game-guides/state-of-survival/sos-daily-to-do-list-en.html

Reference example B — milestone chests across the top

Source	Game of Thrones: Conquest Daily Quests chest ladder
Pattern fit	Strong fit for a chest-based reward track
Why it is useful	Shows a clear top-row milestone ladder: total points, multiple chest unlocks, and a reset timer. Good pattern if your quest system also has a meta chest.
Reference URL	https://www.gotconquest.com/news/2020/10/14/daily-quests-login-rewards/

3. Instant Reward Popup

A modal that appears immediately on login and focuses the player on one reward moment. This is the lightest-weight daily reward implementation.

Styling cues
- Centered modal with large reward art
- Darkened backdrop and strong focus framing
- Single primary CTA
- Celebration FX such as sparkles, bursts, or chest opening animation
- Optional secondary CTA for 'view full calendar'

Element	What it does
Reward hero art	Single large reward or chest visual.
Reward title	Daily reward, welcome back, attendance bonus, etc.
Reward amount	Big readable value.
CTA	Claim or Continue.
Dismiss behavior	Explicit close or auto-close after claim.
Optional follow-up link	Open calendar, streak view, or event detail.

Implementation notes
- Best when you want minimal friction and strong daily dopamine.
- Use this if check-in is not meant to dominate the information architecture.
- Often paired with a secondary deeper view for streak history or event attendance.

Reference examples

Reference note

Source	No clean public reference was available in this environment as a standalone popup-only screen
Pattern fit	Commonly derived from standard reward modal patterns
Why it is useful	For your project, treat this as a simplified version of your existing result modal system: one focal reward, one CTA, one strong celebration state.
Reference URL	https://www.bluestacks.com/blog/game-guides/state-of-survival/sos-daily-to-do-list-en.html

4. Quest Checklist Panel

A compact vertical list of daily or weekly objectives. Best when you need to show many tasks at once.

Styling cues
- Dense but readable row list
- Short objective titles
- Progress values aligned consistently
- Reward previews or point values shown per row
- Claim buttons on completed rows
- Tabs or segmented controls for Daily / Weekly / Event / Growth

Element	What it does
Quest row	One objective with progress and reward.
Quest title	Clear action verb + target count.
Progress display	Numeric or textual state.
Reward preview	Currency, XP, item, points, or chest token.
Claim CTA	Available when the quest is complete.
Tab/filter control	Switches between objective groups.

Implementation notes
- Best for operational clarity and fast scanning.
- A good default if you expect many daily tasks.
- Be careful to keep reward and progress alignment consistent to reduce cognitive load.

Reference examples

Reference example A — dense daily quest list

Source	Mobile Legends Daily Quests
Pattern fit	Strong fit for a checklist panel
Why it is useful	Shows multiple tasks in a dense grid/list treatment, visible rewards per task, and bottom activity milestones. Useful for fast-scanning dailies.
Reference URL	https://www.bluestacks.com/blog/game-guides/mobile-legends-bang-bang/mobile-legends-beginner-guide-en.html

Reference example B — list with claim buttons

Source	State of Survival Missions
Pattern fit	Strong fit for a vertical checklist with direct claim CTAs
Why it is useful	Shows the common structure of repeatable daily rows paired with a right-aligned claim button.
Reference URL	https://www.bluestacks.com/blog/game-guides/state-of-survival/sos-daily-to-do-list-en.html

---

5. Quest Card Layout

A richer card treatment where each objective becomes its own module. Best when missions should feel important, thematic, or actionable.

Styling cues
- Card containers with more spacing than a list row
- Stronger iconography or artwork
- Visible progress bar
- One clear primary action
- Status badge or card state treatment
- Works well with mission categories and deep links

Element	What it does
Card shell	Visual grouping and state container.
Icon / thumbnail	Task theme or mission category art.
Headline + subcopy	What to do and why.
Progress bar	Strong completion meter.
Reward block	Preview of all outputs.

Action CTA	Go, Start, Craft, Claim, or View.

Implementation notes
• Use this if your quest panel doubles as a navigation layer into missions, crafting, or buildings.
• This is usually the best fit for an idle game with multiple systems because cards can route the user to the right place.
• If you go card-first, keep card height disciplined so the screen does not become visually noisy.

Reference examples

Reference example A — single task module anatomy

Source	Game of Thrones: Conquest single quest row
Pattern fit	Useful as a compact card anatomy reference
Why it is useful	Shows the core pieces you need in card form: icon, title, point value, progress bar, completion stars, and a direct action button.
Reference URL	https://www.gotconquest.com/news/2020/10/14/daily-quests-login-rewards/

6. Quest Completion Milestone

A meta reward earned by completing multiple quests. This is one of the most effective ways to make small tasks feel like part of a larger loop.

Styling cues
• Chest ladder or completion rail
• Threshold markers like 30 / 60 / 95 / 130
• Bigger visuals at milestone rewards
• Completion state clearly visible
• Usually pinned to top or bottom of the quest view

Element	What it does
Milestone ladder	Sequence of thresholds.
Reward container	Chest or premium reward object.
Current score	Running total or completed quest count.
Threshold labels	Values the player is chasing.
Claim state	Unopened, claimable, claimed.
Reset timer	When the track restarts.

Implementation notes
• This is the highest-leverage addition if you want daily quests to feel sticky.
• It turns a scattered set of chores into one coherent objective loop.
• For your game, a chest that grants currency, crafting mats, or an occasional rare item is a strong fit.

Reference examples

Reference example A — bottom milestone ladder

Source	Mobile Legends Daily Activity Score / Weekly Activity Score
Pattern fit	Strong fit for a daily quest meta reward
Why it is useful	Shows thresholds and milestone rewards beneath the individual tasks, which is exactly how a daily-completion chest is usually communicated.
Reference URL	https://www.bluestacks.com/blog/game-guides/mobile-legends-bang-bang/mobile-legends-beginner-guide-en.html

Reference example B — top chest ladder

Source	Game of Thrones: Conquest Daily Quests chest progression
Pattern fit	Strong fit for a top-mounted milestone strip
Why it is useful	Useful if you want the meta reward visible before the player scrolls through the task list.
Reference URL	https://www.gotconquest.com/news/2020/10/14/daily-quests-login-rewards/

Recommended front-end component breakdown

This is a suggested engineering decomposition for the UI patterns above. The point is to keep reward logic, display metadata, and action handling separated cleanly.

Element	What it does
DailyRewardContainer	Owns fetch state, countdowns, and eligibility.
RewardTrack	Renders a calendar or horizontal sequence of reward nodes.
RewardNode	Single reward cell with availability and rarity state.
RewardClaimButton	Handles claim CTA and optimistic loading state.
QuestList	Owns tab/filter selection and row/card ordering.
QuestRow / QuestCard	Displays title, progress, rewards, and CTA.
QuestMetaProgress	Displays daily completion score and milestone chests.
QuestActionRouter	Maps button presses to the right deep link or modal.

Suggested state model

Element	What it does
available	Can be claimed now.
claimed	Already claimed.
locked	Future day or unmet requirement.
in_progress	Task visible but incomplete.
complete_unclaimed	Task complete and waiting for claim.
expired/reset	State after rollover or streak reset if used.

Suggested reward display rules

- Always show the primary reward icon first, then amount, then rarity treatment.
- When multiple rewards exist, show at most 3 inline and collapse the rest behind a '+N' token or detail drawer.
- Use one consistent completion color for all claimable states.
- Show timers only where they change player behavior: reset timer, next reward, or event end.

Reference sources used

These public pages were used as implementation references for common patterns. They are listed here so your team can review the original screenshots and UI layouts directly.

Source	What it contributes
BlueStacks — Mobile Legends Beginner Guide	Dense daily quest layout, reward-per-task framing, and bottom milestone rewards.
BlueStacks — State of Survival Daily Checklist	Sign-in rewards, point-based reward track, and right-aligned claim buttons.
Game of Thrones: Conquest — Daily Quests & Login Rewards	Single quest anatomy, milestone chest ladder, reset timer, and progress framing.
